

# **My Combine Health & Safety Notice**

**Effective Date: 2026-08-13**

My Combine includes athletic testing and training activities that may involve sprinting, jumping, rapid acceleration, deceleration, change-of-direction movements, agility work, and maximal or near-maximal physical exertion.

Your safety comes before any workout, score, personal record, or test result.

Please review this Health & Safety Notice before participating.

## **1. Know Your Health and Physical Condition**

My Combine is designed for athletic performance testing and training. It is not medical advice and does not determine whether you are medically fit to exercise.

Before participating, consider your current health, physical condition, training experience, injuries, and limitations.

Consult an appropriate qualified healthcare professional before beginning or continuing strenuous physical activity when you have concerns about your ability to participate safely or have been advised to obtain medical clearance.

Do not participate while impaired by alcohol, recreational drugs, or anything else that makes it unsafe for you to exercise.

## **2. Stop When Something Feels Wrong**

Stop exercising if you experience concerning symptoms, including:

- Chest pain or pressure
- Fainting or feeling as though you may faint
- Severe or unusual dizziness
- Unusual or severe shortness of breath
- Sudden or significant pain
- Loss of coordination or balance
- Confusion
- Severe weakness
- Symptoms of heat illness
- Any other symptom that makes continued exercise feel unsafe

Seek appropriate medical attention when necessary.

Do not continue a test or workout simply to complete a score, personal record, streak, or training session.

### **3. Inspect Your Training Area**

Before beginning any My Combine activity, inspect the area where you will train.

Make sure:

- You have enough space to complete the drill and safely decelerate afterward
- The area is clear of vehicles, pedestrians, equipment, walls, fences, holes, debris, and other obstacles
- The surface is reasonably level and appropriate for the activity
- The surface is not excessively wet, slippery, damaged, or otherwise unsafe
- Cones, phones, timing devices, and other equipment are positioned where they will not become hazards
- Lighting and visibility are adequate

Never sprint into traffic, through an active roadway, or toward a dangerous obstruction.

### **4. Allow Enough Space to Stop**

Sprint and agility drills require more space than the measured drill distance.

Always leave sufficient additional room after the finish point to decelerate safely.

Do not position finish lines, timing devices, cones, walls, fences, equipment, or other obstacles in a way that requires sudden or unsafe stopping.

### **5. Warm Up Before High-Intensity Activity**

Complete an appropriate warmup before sprinting, jumping, agility testing, maximal-effort testing, or other high-intensity exercise.

Do not perform maximal or near-maximal efforts when your body is not adequately prepared.

Follow the warmup and instructional guidance provided by My Combine when appropriate, while recognizing that you remain responsible for determining what preparation is appropriate for you.

### **6. Use Appropriate Footwear and Equipment**

Wear footwear appropriate for the surface and activity.

Inspect your footwear and any equipment before use.

Do not use damaged, unstable, improperly positioned, or inappropriate equipment.

Phones, timing remotes, cones, tripods, sensors, and other equipment should be placed so they do not interfere with your running path or deceleration area.

## **7. Consider Weather and Environmental Conditions**

Environmental conditions can substantially affect safety and performance.

Use caution when training in:

- Extreme heat
- High humidity
- Extreme cold
- Rain
- Wet or slippery conditions
- Poor visibility
- Strong wind
- Lightning or thunderstorms
- Other hazardous weather

Postpone or modify training when conditions are unsafe.

Maintain appropriate hydration and take additional rest when environmental conditions increase physical stress.

## **8. Manage Fatigue**

Fatigue can reduce coordination, reaction time, running mechanics, and judgment.

Take appropriate rest between high-intensity efforts.

Stop or modify a workout when fatigue makes proper execution difficult or unsafe.

Do not sacrifice safety or technique to achieve a faster time, higher score, personal record, or completed workout.

## **9. Use Appropriate Technique and Progression**

Perform drills and exercises within your current capabilities.

Beginners should progress gradually and should not feel pressured to immediately perform advanced drills or maximal efforts.

Review available technique instructions before attempting unfamiliar movements.

If you do not understand how to safely perform an activity, do not attempt it until you have obtained appropriate instruction.

## **10. Training Alone**

Use additional caution when performing high-intensity exercise alone.

When appropriate, consider having another person nearby, particularly during maximal-effort testing, unfamiliar activities, or training in isolated locations.

Make sure you have reasonable access to communication and assistance if needed.

## **11. Performance Technology Is Not Safety Technology**

My Combine may use phones, software, timing controls, remote hardware, or other technology to measure athletic performance.

Do not rely on these systems to detect injuries, medical emergencies, unsafe conditions, or environmental hazards.

Technology may fail, disconnect, or provide inaccurate results.

A timing result is never more important than your safety.

## **12. Minors**

Minors should use My Combine only with appropriate parent or legal guardian involvement, consent, and supervision consistent with their age, maturity, activity, and applicable law.

Parents and guardians should review the planned activities and training environment before allowing a minor to participate.

## **13. Emergencies**

My Combine does not monitor your workout and cannot contact emergency services on your behalf.

If you experience or observe a medical emergency, stop activity and contact appropriate local emergency services immediately.

## **14. Your Responsibility**

You are ultimately responsible for deciding:

- Whether you are physically prepared to participate
- Whether the activity is appropriate for you
- Whether the training environment is safe
- Whether weather and surface conditions are appropriate
- Whether you have adequate space and equipment
- Whether you should stop, modify, or postpone an activity

When in doubt, prioritize safety over completing the workout or recording a performance result.
